

What Is the Difference Between CCT and CRI?

CCT (Correlated Color Temperature) represents the actual color of the light, measured in Kelvin. Generally LED lights will range from 2700K - 6500K depending on the desired light appearance.

- 1000K** Candelight
- 2000K** Tungsten Light
- 3000K** Household Light Bulbs
- 4000K** Natural White
- 5000K** Daylight
- 6000K** Cool White
- 7000K** Overcast
- 10000K** Sky Blue

CRI (Color Rendering Index) refers to how a light source renders the colors of other objects and surfaces. This is measured on a scale of 1-100 and the closer to 100 the more accurate object colors appear.
